

SAFETY MESSAGE

Your Personal Safety is our #1 priority

Sun Safety, Compiled by USDA-APHIS-CCEP

The short-term results of unprotected exposure to UV rays are tanning and sunburn. Sun tanning and sun burns increase the risk of skin cancer so it is important to protect yourself from the sun's damaging rays.

UV Index

- Indicates the amount of UV (ultraviolet) radiation reaching the earth's surface during an hour around noon
- The higher the number the greater the exposure to UV radiation

Sun Safety Tips

- Try to stay in the shade during the heat of the day
- Wear light colored, loose fitting clothing that covers exposed skin
- Wear a wide brimmed hat
- Wear sunglasses with UV protection
- Protect yourself even on a cloudy day—unseen UV rays can still cause damage
- Use a sunscreen with at least SPF 15
- Some drugs & cosmetics—Tetracycline, diuretics, and major tranquilizers—may increase susceptibility to sunburn because they contain substances that cause the skin to absorb more of the sun's radiation; contact your pharmacist or physician for more information
- **A sunscreen's Sun Protection Factor (SPF) number refers to the factor by which it enhances a person's natural sun protection—if someone normally burns in 20 minutes, then a sunscreen with an SPF of 15 would protect them for 300 minutes (SPF 15 x 20 minutes = 300 minutes)**
